Follow the blueprint in this book to launch a library DIY community history digitization program—one that provides the access and fosters engagement with patrons to sustain the program over time. • Takes readers through establishing local history digitization projects at the community level from start to finish, providing guidance on how to set up, maintain, and sustain ongoing digitization projects • Describes how to train library users for digitization—instructions that are also applicable for including volunteers in digitization projects • Explains how creating a DIY history digitization project can provide a community benefit and serve as a form of outreach that also enriches a library's local history collection

Until recently, a majority of the applications of X-ray computed tomography (CT) scanning in plant sciences remained descriptive; some included a quantification of the plant materials when the root-soil isolation or branch-leaf separation was satisfactory; and a few involved the modeling of plant biology processes or the assessment of treatment or disease effects on plant biomass and structures during growth. In the last decade, repeated CT scanning of the same plants was reported in an increasing number of studies in which moderate doses of X-rays had been used. Besides the general objectives of Frontiers in Plant Science research topics. " Branching and Rooting Out with a CT Scanner " was proposed to meet specific objectives: (i) providing a non-technical update on knowledge about the application of CT scanning technology to plants, starting with the type of CT scanning data collected (CT images vs. CT numbers) and their processing in the graphical and numerical approaches; (ii) drawing the limits of the CT scanning approach, which because it is based on material density can distinguish materials with contrasting or moderately overlapping densities (e.g., branches vs. leaves, roots vs. non-organic soils) but not the others (e.g., roots vs. organic soils); (iii) explaining with a sufficient level of detail the main procedures used for graphical, quantitative and statistical analyses of plant CT scanning data, including fractal complexity measures and statistics appropriate for repeated plant CT scanning, in experiments where the research hypotheses are about biological processes such as light interception by canopies, root disease development and plant growth under stress conditions; (iv) comparing plant CT scanning with an alternative technology that applies to plants, such as the phenomics platforms which target leaf canopies; and (v) providing current and potential users of plant CT scanning with up-to-date information and exhaustive documentation, including clear perspectives and well-defined goals for the future, for them to be even more efficient or most efficient from start in their research work.

Present Your Research to the World! The World Congress 2009 on Medical Physics and Biomedical Engineering – the triennial scientific meeting of the IUPESM - is the world ' s leading forum for presenting the results of current scientific work in health-related physics and technologies to an international audience. With more than 2,800 presentations it will be the biggest conference in the fields of Medical Physics and Biomedical Engineering in 2009! Medical physics, biomedical engineering and bioengineering have been driving forces of innovation and progress in medicine and healthcare over the past two decades. As new key technologies arise with significant potential to open new options in diagnostics and therapeutics, it is a multidisciplinary task to evaluate their benefit for medicine and healthcare with respect to the quality of performance and therapeutic output. Covering key aspects such as information and communication technologies, micro- and nanosystems, optics and biotechnology, the congress will serve as an inter- and multidisciplinary platform that brings together people from basic research, R&D, industry and medical application to discuss these issues. As a major event for science, medicine and technology the congress provides a comprehensive overview and in – depth, first-hand information on new developments, advanced technologies and current and future applications. With this Final Program we would like to give you an overview of the dimension of the congress and invite you to join us in Munich! Olaf D ö sel Congress President Wolfgang C.

With the popularity of digital photography growing by leaps and bounds over the last decade, some say film has been dying a slow death ever since – or is already dead. The reality is that film has never gone away, and in recent years has experienced a surging, renewed popularity – sometimes simply for its retro, analog status, but mostly for film's ability to create a look and feel that many believe digital can still not achieve. If anyone can attest to this, it's Utah photographer Jonathan Canlas, who exclusively shoots with film, and has both an extremely successful wedding photography business as well as a series of popular workshops held numerous times per year around the world. In Film Is Not Dead: A Digital Photographer's Guide to Shooting Film, Canlas teams up with co-author Kristen Kalp to open the doors for anyone who wants to begin – or return to – shooting film. Casual, irreverent, fun, inspiring, and beautiful, this unique 10x8 hardcover book teaches the reader the basics of film, cameras, and shooting in this medium. Whether it's discussing the different tone and color characteristics of different films (Kodak, Fuji, etc.), how to load a medium-format camera back, how to create proper exposures, how and where to get film processed, or how Jonathan uses fun, plastic cameras like the Holga in his commercial and personal work, Film Is Not Dead appeals to anyone who is searching to finally begin creating that film look, but until now hasn't known where to start.

Scanning negative or transparency analogue film with a consumer grade desktop scanner can be a frustrating experience. This guide will help you get the most out of your analogue images. Follow the step-by-step workflows in this guide to scan an image just once, to obtain an analogue 'RAW file' that contains full highlight and shadow detail. Intended for enthusiast amateur and pro photographers who use or are willing to obtain Adobe Photoshop CS or higher, Silverfast or VueScan scanning software and the ColorPerfect plug-in. Finally, a clear guide to optimize your hybrid analogue to digital workflow.

For the first time ever, world-famous photographer and fashion lighting instructor Frank Doorhof takes you behind the scenes to reveal every step of his model-photography workflow – the same workflow that has made him a hero to photographers around the world thanks to his practical, budget conscious, no-nonsense approach. In this groundbreaking book, Frank starts right at the beginning with how to find models, find great locations, work with backgrounds (you ' ll be amazed at his tricks for creating stunning backgrounds for just a few bucks), and work by yourself or with a team (stylist, hair stylist, and makeup artist) to create an image that will get your photography noticed. Then, it ' s on to an in-depth look at the lighting setups and looks that made Frank famous (complete with diagrams and detailed explanations). You ' ll see how Frank lights his images (you ' ll be shocked at how simple most of his lighting setups are and you ' ll be able to create these same setups yourself), plus he covers the critical little stuff nobody else is talking about, including: how to calibrate your monitor (and why it ' s so important); how to use a color target to nail your color every single time; and why (and how) to use a light meter to get consistent, reproducible lighting each and every shoot. Frank also shares his own retouching techniques through step-by-step tutorials, and he takes you from start to finish through a number of different looks so you can see exactly how it ' s done, and recreate these same looks yourself. If you ' ve ever wished there was one book that covers it all, the whole process of photographing models from start to finish, not leaving anything out, then this is the book for you.

While some manufacturing experts see the maker movement as a step back in education and production, the movement presents a learn-by-doing approach to emerging professionals. Making is a method that takes some resources and modifies these resources in a way that makes the sum more valuable than the parts. European Perspectives on Learning Communities and Opportunities in the Maker Movement is a collection of innovative research on the methods and applications of value creation and problem solving within European learning communities. While highlighting topics including alternative learning methods, biomimetics, connected learning theory, and gentrification, this book is ideally designed for entrepreneurs, business professionals, manufacturers, carpenters, production experts, educators, academicians, industry professionals, researchers, and students seeking current research on the maker movement with examination through case studies.
